This work was performed under contract with NEDO funded by METI as part of the Japanese national project “Strategic Development of Energy Conservation Technology Project”.
Abstract

We are developing a high-efficiency Yb:YAG regenerative amplifier for industrial applications. Optical-to-optical efficiencies have been theoretically calculated to determine efficient amplification conditions. Experimental results show an output pulse energy of more than 2 mJ before compression at a 10-kHz repetition rate with an optical conversion efficiency of 17.8%.
Objectives

High-efficiency Yb:YAG regenerative amplifier for industrial applications

- pulse energy > multi-mJ
- pulse duration < ps
- wall-plug efficiency > 10%
- repetition rate > multi-kHz
- beam quality ~ single mode
- To be a commercial product as an industrial laser for fine laser processing
  
  low cost, compact, simple, high stability, robust, room-temperature operation, easy to handle,
Calculation

Fig. 1. Energy level scheme of Yb:YAG. $f_i$ Are the relative thermal occupancies and the $k_i$'s denote the wave number for the different levels with regard to the ground level.

Rate Equation for pumping

Absorbed power

\[ P_{abs} = P_{pump}(1 - \exp[-\sigma \{N_d f_0 - (f_0 + f_5) N_u \}]) \]

Upper level population

\[ \frac{d N_u}{dt} = \frac{P_{abs}}{E_{PhotonPump}} - \frac{N_u}{\tau_u} \]

\[ N_u(t = 0) = \frac{E_{st0}}{E_{PhotonLaser}} + \frac{f_2}{f_2 + f_4} N_d \]

Stored fluence and small signal gain

\[ \Delta N = f_4 N_u - f_2 (N_d - N_u) \]

\[ E_{st} = E_{PhotonLaser} \Delta N \]

\[ E_s = E_{PhotonLaser} / \sigma_l \]

\[ g_0 l = \sigma_l \Delta N = E_{st} / E_s \]

Fig. 2 Calculated stored fluence
Pulse amplification

Frantz-Nodvik equation

\[ E_{out}^{(n)} = E_s \ln \left\{ 1 + \left[ \exp \left( \frac{E_{in}^{(n)}}{E_s} \right) - 1 \right] \exp \left( \frac{E_{st}^{(n)}}{E_s} \right) \right\} \]

\[ E_{st}^{(n+1)} = E_{st}^{(n)} - \left( E_{out}^{(n)} - E_{in}^{(n)} \right) \]

\[ E_{in}^{(n+1)} = \left( 1 - L_{oss} \right) E_{out}^{(n)} \]

Fig. 3(a) Calculated pulse growth in amplification for the resonator roundtrip loss of 10% with 25 kW/cm\textsuperscript{2} pumping at 10 kHz repetition rate.

Fig. 3(b) Calculated output fluence for 10 kHz repetition rate with pumping in Fig. 2. The pulses were switched out at the peak intensities.
Experiment

- Bow tie type regenerative amplifier with a Pockels cell
- $L \approx 1.4$ m
- Yb:YAG rod 1 at.% doped, 30 mm length
- Pumped by 940 nm fiber-coupled CW-LD from both ends
Fig. 4 Measured output power vs. launched pump power. An output pulse energy of 2.03 mJ before compression was obtained at a 10-kHz repetition rate. The optical conversion efficiency was 17.8%.
Seed FWHM=6.0 nm (186 fs)

Output FWHM=1.0 nm (1.1 ps)
Fig. 6 Comparison with the theory (Fig. 3). The beam diameter of 800 μm is assumed.
Fig. 7 Calculated optical-optical efficiency vs. launched pump intensity. 1% doped, L=40 mm, and resonator loss = 10%.
Summary

- Developing a high-efficiency Yb:YAG regenerative amplifier
- 2.03 mJ (before compression) at 10-kHz
- Optical conversion efficiency of 17.8%.
- Agree with theoretical calculation
- Higher pumping intensity will achieve high efficiency and pulse energy.
- Switch out timing control is useful to reach higher efficiency.
