Exponential of skew-symmetri matrices Screw Motions Example:

Motivation and Contribution

- This is a need for safer robots
 - As of today, even a good robot can unexpectedly fail
 - HRP-2 was number 10 among 23 participants at the Finals of the 2015 DARPA Robotics Challenge
- Our work
 - (does not solve any issue with HRP-2 yet)
 - provides formal theories of
 - 3D geometry
 - rigid body transformations
 - for describing robot manipulators
 - in the Coq proof-assistant [INRIA, $1984\sim$]

Example:

Screw Motions

Mitsubishi RH-S series

What is a Robot Manipulator?

Trigonometric Functions/Relations

Trigonometric functions defined using complex numbers

Basic Elements of 3D Geometry

Robot Manipulators

3D Rotations Rigid Body Transformations Example:

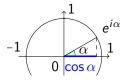

Denavit-Hartenberg

Robot Manipulators with Exponential Coordinates

Exponential of skew-symmetric matrices
Screw Motions
Example:

Trigonometric Functions/Relations

Trigonometric functions defined using complex numbers

• E.g., $\cos(\alpha) \stackrel{\text{in } Coq}{\to} \operatorname{Re} (\exp i \alpha)$

Basic Elements of 3D Geometry

Robot Manipulators with Matrice

3D Rotations Rigid Body Transformations Example:

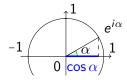

Denavit-Hartenberg Convention

Robot Manipulator with Exponential Coordinates Exponential o

Exponential of skew-symmetri matrices Screw Motions Example:

Trigonometric Functions/Relations

Trigonometric functions defined using complex numbers

- E.g., $\cos(\alpha) \stackrel{\text{in } Coq}{\rightarrow} \operatorname{Re} (\exp i \alpha)$
- E.g., $\arcsin(x) \stackrel{\text{def}}{=} \arg\left(\sqrt{1-x^2} + xi\right)$ $\stackrel{\text{in Coq}}{\to} \arg\left(\text{Num.sqrt}\left(1 x^2\right) + i * x\right)$

Basic Elements of 3D Geometry

Robot Manipulators with Matrice

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

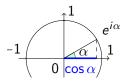

Robot Manipulators with

Exponential Coordinates

Exponential of skew-symmetric matrices Screw Motions Example:

Trigonometric Functions/Relations

Trigonometric functions defined using complex numbers

- E.g., $\cos(\alpha) \stackrel{\text{in } Coq}{\rightarrow} \operatorname{Re} (\exp i \alpha)$
- E.g., $\arcsin(x) \stackrel{\text{def}}{=} \arg\left(\sqrt{1-x^2} + xi\right)$ $\stackrel{\text{in } Coq}{\to} \arg\left(\text{Num.sqrt}\left(1 x^2\right) + i * x\right)$

Standard trigonometric relations recovered easily:

- Lemma acosK $x : -1 \le x \le 1 \rightarrow \cos(a\cos x) = x$.
- Lemma $sinD \ a \ b : sin (a+b) = sin \ a * cos \ b + cos \ a * sin \ b.$
- . . .

Basic Elements of

Robot Manipulators

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

Robot Manipulators with Exponential

Exponential of skew-symmetric matrices Screw Motions Example:

Denavit-Hartenberg Convention

Convention for the relative positioning of frames

Basic Elements of 3D Geometr

Robot Manipulators with Matrice

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

Robot Manipulators with Exponential

Exponential of skew-symmetric matrices
Screw Motions
Example:

Denavit-Hartenberg Convention

- Convention for the relative positioning of frames
 - Consecutive frames i and j are such that
 - 1) $(o_j, \vec{x_j})$ and $(o_i, \vec{z_i})$ are perpendicular
 - 2) and intersect

Basic Elements of 3D Geometr

Robot Manipulators with Matrice

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg

Robot Manipulators with Exponential Coordinates

Exponential of skew-symmetri matrices Screw Motions Example:

Denavit-Hartenberg Convention

- Convention for the relative positioning of frames
 - Consecutive frames i and j are such that
 - 1) $(o_j, \vec{x_j})$ and $(o_i, \vec{z_i})$ are perpendicular
 - 2) and intersect
 - The corresponding RBT can then be written ${}^hR_x(\alpha){}^hT_x(a){}^hT_z(d){}^hR_z(\theta)$

5 Conclusion

Exponential of skew-symmetric

matrices

Exponential Coordinates of Rotations

Alternative representation with less parameters

•
$$e^{\alpha S(w)}$$
 where $S(w) = \begin{bmatrix} 0 & w_z & -w_y \\ -w_z & 0 & w_x \\ w_y & -w_x & 0 \end{bmatrix}$

Robot Manipulators with Exponential

Exponential of skew-symmetric matrices

Screw Motion Example: SCARA

Exponential Coordinates of Rotations

Alternative representation with less parameters

•
$$e^{\alpha S(w)}$$
 where $S(w) = \begin{bmatrix} 0 & w_z & -w_y \\ -w_z & 0 & w_x \\ w_y & -w_x & 0 \end{bmatrix}$

• We could use a generic matrix exponential $e^M = 1 + M + \frac{M^2}{2!} + \frac{M^3}{2!} + \cdots$

Robot Manipulators with Matrices

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

Robot Manipulators with Exponential

Exponential of skew-symmetric

matrices Screw Motion Example: SCARA

Exponential Coordinates of Rotations

Alternative representation with less parameters

•
$$e^{\alpha S(w)}$$
 where $S(w) = \begin{bmatrix} 0 & w_z & -w_y \\ -w_z & 0 & w_x \\ w_y & -w_x & 0 \end{bmatrix}$

- We could use a generic matrix exponential $e^M = 1 + M + \frac{M^2}{2!} + \frac{M^3}{2!} + \cdots$
- ullet But when M is skew-symmetric, there is closed formula

$$e^{\alpha S(w)} \stackrel{\text{def}}{=} 1 + \sin(\alpha)S(w) + (1 - \cos(\alpha))S(w)^2$$

(Rodrigues' formula)

Screw Motions
Example:

What is a Screw Motion?

An axis (a point and a vector), an angle, a pitch

Basic Elements of

Robot Manipulators

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

Robot Manipulators with

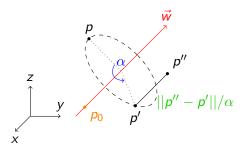

Exponential Coordinates

Exponential of skew-symmetrices

Screw Motions Example: SCARA

What is a Screw Motion?

• An axis (a point and a vector), an angle, a pitch

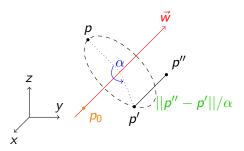

- Translation and rotation axes are parallel
 - This was not required for homogeneous representations

Screw Motions

What is a Screw Motion?

• An axis (a point and a vector), an angle, a pitch

- Translation and rotation axes are parallel
 - This was not required for homogeneous representations
- ⇒ Are screw motions RBT?
 - See the paper for Chasles' theorem ("the first theorem of robotics")

Robot Manipulators with Exponential

Coordinates

Screw Motions
Example:

Represent Screw Motions with Exponentials of Twists

• To represent screw motions, we can use $e^{\alpha \begin{bmatrix} S(w) & 0 \\ v & 0 \end{bmatrix}}$

Basic Elements of 3D Geometry

Robot Manipulators with Matrice

3D Rotations Rigid Body Transformations Example:

Denavit-Hartenberg Convention

Robot Manipulators with Exponential

Exponential of skew-symmetri

Screw Motions
Example:

Represent Screw Motions with Exponentials of Twists

• To represent screw motions, we can use $e^{\alpha \begin{bmatrix} S(w) & 0 \\ v & 0 \end{bmatrix}}$

With $v = -w \times p_0 + hw$ we recover the screw motion of the previous slide

Screw Motions Example: SCARA

Represent Screw Motions with Exponentials of Twists

• To represent screw motions, we can use $e^{\alpha \begin{bmatrix} S(w) & 0 \\ v & 0 \end{bmatrix}}$

With $v = -\mathbf{w} \times p_0 + h\mathbf{w}$ we recover the screw motion of the previous slide

• The pair of vectors (v, w) is called a **twist**

Exponential Coordinates

Exponential o skew-symmetr

Screw Motions
Example:
SCARA

Represent Screw Motions with Exponentials of Twists

• To represent screw motions, we can use $e^{\alpha \begin{bmatrix} S(w) & 0 \\ v & 0 \end{bmatrix}}$

With $v = -\mathbf{w} \times p_0 + h\mathbf{w}$ we recover the screw motion of the previous slide

- The pair of vectors (v, w) is called a **twist**
- Luckily, there is a closed formula for $e^{\alpha \begin{bmatrix} S(w) & 0 \\ v & 0 \end{bmatrix}}$

$$\begin{cases} \begin{bmatrix} I & 0 \\ \alpha v & 1 \end{bmatrix} & \text{if } w = 0 \\ \begin{bmatrix} e^{\alpha S(w)} & 0 \\ \frac{(w \times v)(1 - e^{\alpha S(w)}) + (\alpha v)(w^{T}w)}{||w||^{2}} & 1 \end{bmatrix} & \text{if } w \neq 0 \end{cases}$$

Future Work

- Various technical improvements
 - Better theory of lines, dependent types to link coordinates with frames
- Instantiate real closed field using classical reals
 - we have been using discrete real closed fields
 - because in MATHEMATICAL COMPONENTS every algebraic structures must have a decidable Leibniz equality
 - yet, equality for classical reals can be assumed decidable
- Application to concrete software
 - by showing preservation of invariants
 - we could use CoRN ideas to bridge with a computable alternative [Kaliszyk and O'Connor, CoRR 2008] [Krebbers and Spitters, LMCS 2011]
 - using CoqEAL for program refinements
 [Dénès et al., ITP 2012] [Cohen et al., CPP 2013]
- Extension with velocity
